

Low-loss distribution network automation for smart buildings

Overview

This paper proposes a hierarchical coordination framework for the coordinated operation of distribution networks and smart buildings. Conventional centralized dispatch approaches are constrained by communication. The optimization of power distribution networks is a critical challenge in the evolving energy sector, where increasing demand, aging infrastructure, and the integration of distributed energy resources necessitate smarter, more resilient systems. As demand grows, the challenge is not just to distribute energy, but to do so. Smart building fibre optic systems, FTTH buildings and KNX LAN networking form the backbone of modern building automation through highly available optical fibre infrastructure with bandwidth up to 10 Gbit/s per fibre. Integration of fibre optic technology directly to individual floors enables, for. Ensure maximum resilience, efficiency and sustainability with Siemens' digitally supported smart power distribution for reliable power supply. It covers various ways this solution can be used, including: ● Monitoring secondary substations for scenarios like Fault Location, Isolation, and Service Restoration (FLISR) and Volt/VAR.
