

Optical cable stripping strip

Article Overview

Optical cable stripping involves removing the protective coatings or jackets from fiber optic cables using precision tools to expose the bare glass without damaging it.

Overview of Fiber Stripping

Optical fibers are coated with polymers such as acrylate, silicone, or polyimide to protect the glass core. Stripping these coatings is essential for splicing, connectorization, or other fiber processing tasks. The goal is to expose the bare fiber while avoiding scratches or nicks that could compromise performance. Typical coated fiber diameters are around 250 μm , with the glass cladding at 125 μm , though specialty fibers may have thinner coatings or larger jackets.

Types of Fiber Strippers

- **Mechanical Handheld Strippers:** Use precision blades to remove coatings or buffers. They are color-coded for different fiber diameters and often include fiber guides to ensure proper alignment.
- **Thermo-Mechanical Strippers:** Apply heat to soften the coating before removal, reducing the risk of fiber damage.
- **Non-Contact Methods:** Include hot air or laser ablation for delicate or specialty fibers, often used in automated systems.
- **Chemical Stripping:** Uses solvents or acids to dissolve coatings, typically in laboratory or high-precision applications.
