

Should vertical cables in the power supply room be routed through cable trays

Overview

Why It Matters: High-voltage and limited energy circuits routed too closely can cause cross-talk, distortion, or packet errors, especially in dense cable trays or congested ceiling spaces. **Best Practice:** Use separate trays, conduits, or divider systems to isolate voltage classes. **Coordinate with Building Structure:** Cable tray routing should align with architectural design, avoiding unnecessary crossings, detours, or overlaps with other pipelines. **EMI risk increases with parallel runs and long shared pathways.** An effective layout ensures safety, minimizes interference, reduces maintenance time, and keeps the overall. **Clearances:** Maintain at least 12 inches of vertical clearance above trays for installation and maintenance access (2026 NEC update). **Fill Rules for Single-Conductor Cables 4.**
