

The cable tray is making a hissing sound

Article Overview

A hissing sound from a cable tray is usually caused by vibration, loose cables, or electrical interference, and can often be reduced by securing cables and isolating the tray from moving parts.

Mechanical Causes

If your cable tray is part of a movable structure, such as a standing desk, the hissing may result from vibration and resonance. When the tray or its cables move, they can rub against the tray walls, fasteners, or nearby surfaces, producing a soft hiss or buzz. The effect is amplified if the tray holds multiple cables, power bricks, or monitor arms, as the mass of the bundle increases motion and noise. Even a tray that seems quiet when static can hiss when the structure moves. Solutions for mechanical noise:

- Secure cables with ties or Velcro to prevent them from swinging inside the tray.
- Add padding or rubber grommets between cables and metal surfaces to reduce friction.
- Tighten fasteners and check for loose tray components.
- Reorganize cable layout to minimize contact with moving parts.

Electrical Causes

Hissing can also be electrical in nature, especially if the tray carries power or audio cables. Common sources include:

- Electromagnetic interference (EMI) from nearby devices like routers, monitors, or...
