

What does an out-of-band access switch do

Overview

The OOB network is exclusively used for giving administrative access to the company's authorised employees and systems. This access is used to automate, orchestrate, configure, monitor and troubleshoot a given network device, server, application software, or multiple. A typical Out of Band (OoB) Network refers to a specialized, purpose-built management infrastructure designed explicitly to provide secure, reliable, and continuous access to mission-critical production devices, commonly referred to as Managed Network Devices. The primary objective of an OoB. In-band management is the most common method of network management, allowing actual data/production and management traffic to use the same path to communicate with different network nodes. The 'access'. What is an out-of-band management switch?

An out-of-band management switch (also known as an out-of-band serial console or console server) creates an entirely separate, parallel network that's dedicated to the management, orchestration, and troubleshooting of production network infrastructure.
