

What size distribution box should be selected for 15 circuits

Article Overview

For 15 circuits, a distribution box with at least 20-24 spaces is recommended to accommodate current circuits, spare slots, and future expansion.

Calculating the Required Size

When sizing a distribution box for 15 circuits, consider the following steps:

-

Count all circuits: Include all 120V and 240V circuits. Each 120V circuit typically uses one slot, while a 240V circuit uses two slots. For example, if you have 12 single-pole (120V) and 3 double-pole (240V) circuits, the total slots required would be $12 + (3 \times 2) = 18$ slots.

-

Add spare slots: It is recommended to include at least 2 spare slots for troubleshooting or minor additions. This ensures you can safely add circuits without replacing the entire panel.

-

Plan for future growth: Add 20-25% extra capacity to accommodate future upgrades, such as additional appliances, EV chargers, or solar panels. For 18 slots, 25% extra would be about 4-5 additional slots, bringing the total to approximately 22-23 slots.
